Novel Coronavirus (COVID-19) - preparedness and response

Pan American Health Organization / World Health Organization (PAHO/WHO)
What is COVID-19?

Coronaviruses

- Large family of viruses
- Can cause illness in animals (common) or humans
- In humans, they cause respiratory infections
- E.g.s.: Common cold; Middle East Respiratory Syndrome (MERS); Severe Acute Respiratory Syndrome (SARS); Coronavirus disease COVID-19

COVID-19:

- Infectious respiratory disease caused by the most recently discovered coronavirus
- This new virus and disease were unknown before the outbreak began in Wuhan, China, in December 2019
- Animal source under investigation
CURRENT SITUATION
Global situation as at 19 March 2020

Total (new) cases in last 24 hours

Globally:
• 209,839 confirmed (16,556)
• 8,778 deaths (828)

European region
• 87,108 confirmed (10,221)
• 4,084 deaths (591)

Western Pacific Region
• 92,333 confirmed (488)
• 3,377 deaths (20)

Region of the Americas
• 9,144 confirmed (4,166)
• 119 deaths (50)
Number of COVID-19 cases in the region of the Americas as of 19 March 2020

WHO Grade 3 Emergency Response

Early January 2020: COVID-19 declared grade 3

GRADE 3 DEFINITION:

• A single or multiple country event with substantial public health consequences that **requires a substantial WHO Country Office (WCO) response** and/or substantial international WHO response.
Public Health Emergency of International Concern (PHEIC)

• 30 January 2020 WHO Director General declared COVID-19 a PHEIC

• PHEIC is defined in the IHR (2005) as “an extraordinary event which is determined, as provided in these Regulations:

  - to constitute a public health risk to other States through the international spread of disease and

  - to potentially require a coordinated international response”. This definition implies a situation that: is serious, unusual or unexpected; carries implications for public health beyond the affected State’s national border; and may require immediate international action
Public Health Emergency of International Concern (PHEIC)

• Requires convening of a committee of experts (IHR Emergency Committee) to advise the WHO Director General

• PHEIC declared by WHO Director-General

• Temporary recommendations issued include health measures to be implemented by the State Party experiencing the PHEIC, or by other States Parties, to prevent or reduce the international spread of disease and avoid unnecessary interference with international traffic
Pandemic

- 11 March WHO DG declared a COVID-19 pandemic
- Definition: a worldwide epidemic/outbreak
- First pandemic by a coronavirus
- We have never controlled pandemic before
- Needs a whole-of-government, whole-of-society approach, based on a comprehensive strategy to prevent infections
- Aim: Save lives and minimize impact
COVID-19 symptoms

• Most common: fever, tiredness, and dry cough
• Also aches and pains, nasal congestion, runny nose, sore throat, diarrhea
• Symptoms usually mild and begin gradually
• Some infected persons don’t develop any symptoms and don't feel unwell
• Persons usually develop symptoms 1-14 days (mostly around 5 days) after catching the virus
COVID-19 symptoms (cont’d)

• Most people, about 80%, recover without needing medical treatment
• About 14% become severely ill, some with difficulty breathing
• About 6% require critical care
• About 2% of people with the disease have died
• Those at risk of more severe illness:
  • Older people
  • Those with underlying medical problems (e.g. high blood pressure, heart problems, diabetes

People with fever, cough and difficulty breathing should seek medical attention
Treatments and vaccines for COVID-19

Antibiotics:
• Antibiotics only work on infections caused by bacteria, NOT those caused by viruses
• COVID-19 is caused by a virus, so antibiotics cannot work on COVID-19
• If hospitalized for COVID-19, a person may receive antibiotics for co-infection with a bacteria

Vaccine:
• There is currently no vaccine to prevent COVID-19
• Flu vaccine does not protect against COVID-19
Treatments and vaccines for COVID-19

Currently there is no vaccine and no antiviral medicine to prevent or treat COVID-2019

Persons are treated to relieve symptoms

People with serious illness should be hospitalized and most recover with supportive care

Possible vaccines and treatments are currently under investigation
How to protect against COVID-19

The most effective ways to protect yourself and others against COVID-19 are:

• Frequently clean your hands with soap and water or alcohol-based hand rub
• Maintain a distance of at least 1 meter (3 feet) from people who are coughing or sneezing
• Avoid touching mouth, nose and eyes
• If ill, cover your cough or sneeze with the bend of elbow or tissue and throw the tissue away
• Stay home if unwell
• If you have a fever, cough and difficulty breathing, seek medical attention as soon as possible
• Stay informed on the latest developments about COVID-19
Use of masks

• Well people do not need to wear a mask

• Masks are useful for:
  • People who have symptoms of COVID-19 (coughing or sneezing)
  • Those caring for ill persons, e.g. health workers and other people taking care of ill persons or suspected COVID-19 cases

• Irrational use of masks will result in wastage and risk of unavailability for those who need them and increased risk of spread
Myth busters

The following may help you to feel better; but they **DO NOT PREVENT** you from getting COVID-19 and the **DO NOT CURE** COVID-19:

- Bush bath
- Bush tea
- Vitamin C / Zinc
- Hot toddy
- Garlic and other spices
- Keeping your mouth moist
- Using oils or gels in nostrils or on the body
- Using disinfectant or bleach on the body
How to protect myself
Protect yourself and others from getting sick

Wash your hands

- after coughing or sneezing
- when caring for the sick
- before, during and after you prepare food
- before eating
- after toilet use
- when hands are visibly dirty
- after handling animals or animal waste
Protect others from getting sick

Avoid close contact when you are experiencing cough and fever

Avoid spitting in public

If you have fever, cough, and difficulty breathing seek medical care early and share previous travel history with your health care provider.
Protect others from getting sick

When coughing and sneezing **cover mouth and nose** with flexed elbow or tissue – throw tissue away immediately and wash hands.

**Throw tissue into a closed bin immediately after use**

**Clean hands** with alcohol-based hand rub or soap and water after coughing or sneezing and when caring for the sick
Infection Prevention and Control
Infection Prevention and Control and COVID-19

- Limit human-to-human transmission
- Reduce secondary infections
- Prevent transmission through amplification and super-spreading events
Standard precautions

1985
- HIV
- Universal precautions

1987
“Body substance isolation”

1996
- Standard precautions
- Transmission-based precautions

Standard precautions

“(…) A set of practices that are applied to the care of patients, regardless of the state of infection (suspicion or confirmation), in any place where health services are provided. (...)”

PAHO. Prevention and Control of Healthcare associated infections – Basic Recommendations”- PAHO, 2017 (adapted)
Standard precautions

- Hand hygiene (water and soap or alcohol-based solutions)
- Use of personal protective equipment (PPE) according to risk
- Respiratory hygiene (or cough etiquette)
- Safe injection practices
- Sterilization / disinfection of medical devices
- Environmental cleaning

PAHO. Prevention and Control of Healthcare associated infections – Basic Recommendations”- PAHO, 2017 (adapted)
Transmission-based precautions

- Contact precaution
- Droplet precaution
- Airborne precaution
Transmission-based precautions and COVID-19

Risk evaluation and PPE

Type of interaction with the patient

Amount of body fluid that will be generated

Mode of transmission of the disease

PAHO. Prevention and Control of Healthcare associated infections – Basic Recommendations”- PAHO, 2017 (adapted)
Some questions to consider . . .

- Does the patient fulfill case definition criteria for the disease?
- What is the infectious agent and its mode of transmission?
- What type of procedure will the patient be undergoing?
- Is there any risk of contamination?
- Where should the patient be located?
- What type of PPE will need to be used?
General principles of PPE

Hand hygiene should always be performed despite PPE use.

Remove and replace if necessary any damaged or broken pieces of re-usable PPE as soon as you become aware that they are not in full working order.

Remove all PPE as soon as possible after completing the care and avoid contaminating the environment outside the isolation room; any other patient or worker; and yourself.

Discard all items of PPE carefully and perform hand hygiene immediately afterwards.

Source: https://apps.who.int/iris/handle/10665/69793
Gloves (sterile / nonsterile)

- Used to prevent the healthcare worker from being exposed to direct contact with the blood or body fluid of an infected patient

- Gloves DO NOT replace hand hygiene

Source: https://apps.who.int/iris/handle/10665/69793
Gowns (and aprons)

- Used in addition to gloves if there is risk of fluids or blood from the patient splashing onto the healthcare worker’s body.

- The same gown can be used when providing care to more than one patient, but only those patients in a cohort area and only if the gown does not have direct contact with a patient.

- Plastic aprons should be used in addition to gowns if the material of the gown is not fluid repellent and the task to be performed may result in splashes onto the healthcare worker’s body.

Source: https://apps.who.int/iris/handle/10665/69793
Facial mucosa protection (face shield, eye visor, goggles)

- Eye protection, used to protect the eyes, nose or mouth mucosa of the health-care worker from any risk of contact with a patient’s respiratory secretions or splashes of blood, body fluids, secretions or excretions

Source: [https://apps.who.int/iris/handle/10665/69793](https://apps.who.int/iris/handle/10665/69793)
Medical masks (droplet precaution)

- Wear a medical mask when within a 1 metre range of the patient
- Put the patient in a single room or in a room that contains only other patients with the same diagnosis, or with similar risk factors, and ensure that every patient is separated by at least one metre
- Ensure that the transportation of a patient to areas outside of the designated room is kept to a minimum
- Perform hand hygiene immediately after removing the medical mask

Source: https://apps.who.int/iris/handle/10665/69793
Respirator [N95] (airborne precaution)

- Use a respirator whenever entering and providing care within patient isolation facilities ensuring that the seal of the respirator is checked before every use
- Perform hand hygiene immediately after removing the respirator
- Use when doing aerosol-generating procedures

Source: [https://apps.who.int/iris/handle/10665/69793](https://apps.who.int/iris/handle/10665/69793)
**Aerosol-generating procedures (AGP)**

Number of healthcare providers exposed should be limited.

HOSPITAL READINESS

- Leadership
- Coordination
- Information
- Logistics and operations
- Infection prevention and control
- Case management
- Diagnosis
- Isolation
- Administration and Finance
- Rapid identification
In summary,

- The use of personal protective equipment (PPE) by healthcare workers requires an evaluation of the risk related to healthcare-related activities;
- The following precautions are recommended for the care of patients with suspected or confirmed cases of COVID-19:
  - For any suspected or confirmed cases of COVID-19
    - standard + contact + droplet precautions
  - For any suspected or confirmed cases of COVID-19 and AGP
    - standard + contact + airborne precautions

as of February 19, 2020 – subject to change as new evidence become available
